

Enhancing Your Learning with ISLA

Cheng Peng

Contents

ISLA (*Interactive Statistics Learning Applications*) is a set of interactive apps created by the instructor to facilitate your learning in this class.

Goals of ISLA Apps

The goals of creating these apps are outlined in the following

- **Making Stats Concepts Intuitive**

Although most of the concepts and procedures are not abstract, some of them such as sampling distributions involving limiting processes are not intuitive and can even be surprising for beginners. A few **ISLA apps** have used simulations to provide some degree of intuition for these ideas.

- **Reproducing Steps of Procedures**

Most descriptive and inferential procedures are structured. The majority of **ISLA apps** can reproduce the steps involved in these procedures once you grasp the related basic concepts. These steps were described in detail in the lecture notes for the corresponding modules.

- **Generating Solutions**

Due to the structured nature of most procedures, many **ISLA apps** can provide solutions to problems in this class. All you need to do is check the given information, select the appropriate **ISLA app**, and enter the provided details into the input box to generate the solution.

Use ISLA Responsibly

Although most **ISLA apps** can generate solutions to many descriptive and inferential statistics problems, they are **not** designed for completing assignments without a clear understanding of the underlying concepts and procedures. Instead, they are meant to:

- **Make certain concepts more intuitive;**
- **Streamline the structure of your solutions** by following a logical reasoning flow;

- **Validate worked examples** from notes or other resources when you rework them;
- **Check your work** while practicing problems.
